

Name:

Biodiversity structures. Habitats

Definition:

The existence of structures necessary for the life of animals can be related to the level of sustainability of the plot.

Calculation method:

Questions to ask farmers on the online platform:

- Have you seen any nest on the plot?
- Have you seen any hives on the plot?
- Have you seen any spider webs on the plot?

Formula:

$$\text{Indicator} = \frac{N+H+S}{3}$$

Where:

Indicator= Indicator Biodiversity structures

N=Nests (Values: 0 rarely, 1 occasionally, 2 sometimes, 4 usually)

H= Hives (Values: 0 rarely, 1 occasionally, 2 sometimes, 4 usually)

S= Spider webs (Values: 0 rarely, 1 occasionally, 2 sometimes, 4 usually)

Interpretation:

It indicates subjectively the number of structures that are indicators of biodiversity.

Information source:

The different crops surface data are obtained through a survey to farmers.
